GRIP@The Spark Foundation- Data Science & Business Analytics Internship

Author - Shweta Pamane

Task 1: Prediction using Supervised ML

Dataset used: Student Scores

It can be downloaded through the following link - http://bit.ly/w-data (http://bit.ly/w-data (http://bit.ly/w-data)

Problem Statement(s):

*** Predict the percentage of a student based on the no. of study hours.

*** What will be predicted score if a student studies for 9.25 hrs/ day?

Import necessary libraries

```
In [1]: # Importing Libraries required for data analysis
   import pandas as pd
   import numpy as np
   import matplotlib.pyplot as plt
   from sklearn.model_selection import train_test_split
   from sklearn.linear_model import LinearRegression
   from sklearn import metrics
```

Read the data from Dataset

```
In [2]: #Reading the data from Dataset
url = "http://bit.ly/w-data"
data = pd.read_csv(url)
```

In [3]: data

Out[3]:

| | Hours | Scores |
|----|-------|--------|
| 0 | 2.5 | 21 |
| 1 | 5.1 | 47 |
| 2 | 3.2 | 27 |
| 3 | 8.5 | 75 |
| 4 | 3.5 | 30 |
| 5 | 1.5 | 20 |
| 6 | 9.2 | 88 |
| 7 | 5.5 | 60 |
| 8 | 8.3 | 81 |
| 9 | 2.7 | 25 |

In [6]: data.info() #to get the summary of dataframe

In [7]: data.describe() #Summary Of Statistics

Out[7]:

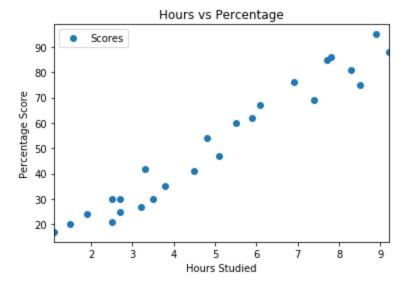

| | Hours | Scores |
|-------|-----------|-----------|
| count | 25.000000 | 25.000000 |
| mean | 5.012000 | 51.480000 |
| std | 2.525094 | 25.286887 |
| min | 1.100000 | 17.000000 |
| 25% | 2.700000 | 30.000000 |
| 50% | 4.800000 | 47.000000 |
| 75% | 7.400000 | 75.000000 |
| max | 9.200000 | 95.000000 |

In [8]: data.size #Size of dataframe which is calculated by number of rows and columns

Out[8]: 50

Visualize the data

```
In [11]: # Plotting the graph for distribution of scores
    data.plot(x='Hours', y='Scores', style='o')
    plt.xlabel('Hours Studied')
    plt.ylabel('Percentage Score')
    plt.title('Hours vs Percentage')
    plt.show()
```

It is evident from the graph that there is a positive linear relation between the number of hours studied and percentage of score.

Prepare the data

```
In [14]: X = data.iloc[:, :-1].values
y = data.iloc[:, 1].values

In [15]: X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random _state=0)
```

Train the Algorithm

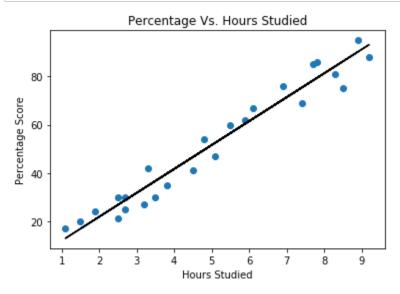

```
In [16]: #training the data
    regressor = LinearRegression()
    regressor.fit(X_train, y_train)

print("The data has been trained")
```

The data has been trained

```
In [17]: # Plotting the regression line
line = regressor.coef_*X+regressor.intercept_
```

```
In [19]: # Plotting for the test data
plt.scatter(X,y)
plt.plot(X,line, color ='black')
plt.xlabel('Hours Studied')
plt.ylabel('Percentage Score')
plt.title('Percentage Vs. Hours Studied')
plt.show()
```

Making Predictions

Compare Actual vs Predicted Score

```
In [22]: # Comparing Actual vs Predicted Score
df = pd.DataFrame({'Actual': y_test, 'Predicted':y_pred})
df
```

Out[22]:

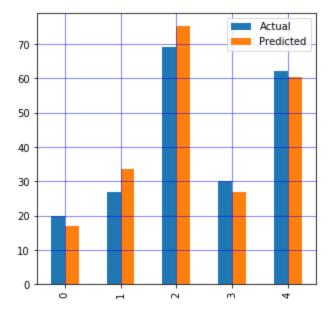

| | Actual | Predicted |
|---|--------|-----------|
| 0 | 20 | 16.884145 |
| 1 | 27 | 33.732261 |
| 2 | 69 | 75.357018 |
| 3 | 30 | 26.794801 |
| 4 | 62 | 60.491033 |

Estimate Training and Test Score

```
In [23]: # Estimating training and test score
    print("Training Score", regressor.score(X_train, y_train))
    print("Test Score", regressor.score(X_test, y_test))
```

Training Score 0.9515510725211553 Test Score 0.9454906892105356

```
In [24]: # Plotting the bar graph to depict the difference between the actual and predic
    ted value
    df.plot(kind='bar',figsize=(5,5))
    plt.grid(which='major', linewidth='0.5', color='red')
    plt.grid(which='major', linewidth='0.5', color='blue')
    plt.show()
```

To find Predicted Score if student studies 9.25 hours a day

```
In [26]: # Predict percent for custom input value for hours
# Q. What will be predicted score if a student studies for 9.25 hrs/ day?
h= 9.25
test= np.array([h])
test = test.reshape(-1,1)
own_pred = regressor.predict(test)
print("No of Hours = {}".format(h))
print("If the student studies for 9.25 hours/day, the score is {}.".format(own_pred[0]))
```

No of Hours = 9.25 If the student studies for 9.25 hours/day, the score is 93.69173248737538.

Evaluating the model

```
In [27]: print('Mean Absolute Error:', metrics.mean_absolute_error(y_test,y_pred))
    print('Mean Squared Error:', metrics.mean_squared_error(y_test,y_pred))
    print('Root Mean Squared Error:', np.sqrt( metrics.mean_squared_error(y_test,y_pred)))
    print('R-2:', metrics.r2_score(y_test, y_pred))

Mean Absolute Error: 4.183859899002975
    Mean Squared Error: 21.5987693072174
    Root Mean Squared Error: 4.6474476121003665
    R-2: 0.9454906892105356
